

Inherited access and automatic membership

 Last updated on June 29, 2025 at 1:00 AM

Feature release date

13 March 2023

What's new?

We've introduced two features:

If a user has inherited access to a file through membership of a shared folder on a shared drive, File Governance can't unshare the permission on that file directly. We've now visualized this hierarchy in the file details side panel. You can even click the folder and unshare the user's access to the folder entirely.

Why have we done this?

Figuring out permissions on files that are within layers of shared drives and folders can be tricky. For this reason, we are currently focusing on the user experience of dealing with shared folders. This change is the first in a series of changes that revolve around shared folders.

In addition, customers need control over exactly how their shared drives are being operated, and we want to make the File Governance operating model as transparent as possible for them. With the "Assign membership" option, it becomes even more flexible how File Governance is configured.
